SUMMARY

Senior platform engineer with 5 years running production infrastructure on AWS, Kubernetes and Terraform. At Agero, owns the platform under four products, including an internal AI agent platform on EKS, at 99.997% availability. Built the CircleCI deployment system (40% faster deploys) and per-PR ephemeral environments, and merges 2.8x more pull requests a month with AI coding agents. CKA, Terraform Associate and AWS Solutions Architect Associate (2023).

SKILLS

Cloud (**Amazon Web Services**)**:** ECS Fargate, EKS, EC2, Lambda, AWS Batch, Step Functions, Aurora PostgreSQL, RDS, S3, OpenSearch, ElastiCache, DynamoDB, IAM, Organizations, KMS, Secrets Manager, CloudTrail

Infrastructure as Code (**IaC**)**:** Terraform, Terraform Cloud, terraform test, GitOps, CloudFormation, Ansible

CI/CD and containers: CircleCI (custom orbs), GitHub Actions, Jenkins, Docker, Kubernetes, Helm, External Secrets, blue/green and canary deploys, ephemeral environments, release automation

Observability and SRE: Datadog, CloudWatch, Fluent Bit, Splunk, PagerDuty, Rollbar, on-call, incident response, root cause analysis, disaster recovery, capacity planning

Security and networking: least-privilege IAM, OIDC, Wiz, Trivy, Snyk, Vault, Okta, WAF, VPC, Transit Gateway, ALB, NLB, Route 53, Cloudflare, Fastly, ACM, DNS, TLS

Databases: PostgreSQL, PostGIS, pgbouncer, Redis, OpenSearch, Snowflake, Fivetran, DynamoDB, MySQL, MongoDB

AI and ML: AI coding agents (OpenCode, Claude, GitHub Copilot), MCP, Amazon Bedrock, SageMaker, MLflow

Languages: Python, Go, Bash, Ruby on Rails, SQL, TypeScript, HCL, Linux

EXPERIENCE

Agero *(roadside assistance technology)* — **Medford, MA** (**Remote**)
Senior DevOps Platform Engineer — **Oct 2024 - Present**

- Run the AWS platform under four products: a multi-region Ruby on Rails app on ECS Fargate, an AI agent platform on EKS using Amazon Bedrock, a batch simulation platform and an ML inference service.
- Own CI/CD for every product team: the shared CircleCI orb and per-environment pipelines, release cuts, hotfixes, rollbacks and canary deploys. Deploys run 40% faster than on the previous Harness setup.
- Work daily with AI coding agents (OpenCode, Claude) under strict guardrails: read-only by default, every command reviewed before it runs, no production access. Merged pull requests went from about 16 to 44 a month (2.8x).
- Keep the main platform at 99.997% availability with Datadog monitoring that cut mean time to detection (MTTD) by 50%, shift-left tests in CI, on-call, incident response and disaster recovery exercises.
- Maintain the security baseline: hardened Docker images (85% fewer critical vulnerabilities), least-privilege IAM built from CloudTrail and Access Advisor data, and GitHub Actions pinned to commit SHAs.
- Operate Aurora PostgreSQL, OpenSearch, ElastiCache, pgbouncer and Fivetran replication to Snowflake.
- Cut toil with Bash, Python, Lambda and Step Functions automation, saving 30+ hours of manual work a month.

Blue Apron — **New York, NY** (**Remote**)
DevOps / SRE Engineer — **Oct 2022 - Oct 2024**

- Ran and upgraded EKS clusters for distributed microservices. Shared Helm charts made deploys 30% more efficient.
- Managed multi-account AWS infrastructure in Terraform and cut infrastructure costs by 20%.
- Designed Jenkins CI/CD pipelines that made deploys 40% faster, and cut developer blocked time by 15% by triaging pipeline failures and provisioning infrastructure.
- Kept 99.9% uptime on a 24/7 on-call rotation, and cut security risk by 25% with Datadog, Rollbar and Snyk.

Alamo Consulting — **Madrid, Spain (Hybrid)**
DevOps Consultant Intern — **Sep 2021 - Aug 2022**

- Built Jenkins pipelines for several client projects, improving deploy efficiency by 25%.
- Cut client AWS costs by 15% and split monolithic apps into Docker-based microservices.

Polytechnic University of Madrid — **Madrid, Spain**
Python Backend Developer — **Feb 2022 - Jul 2022**

- Built a Python client for the REST API of a health research app (medal.ctb.upm.es).

PROJECTS

Agero

- **CircleCI deployment system.** Replaced HarnessCD with a CircleCI orb and pipelines built from scratch: migrations, web and worker deploys, multi-region rollbacks, canaries and post-deploy tests. A 2026 major version deploys three products across separate AWS accounts with OIDC.
- **Per-PR ephemeral environments.** A full copy of the app for each pull request, created from a PR comment and destroyed on close. 30 to 40 run at once, and developer workflows got 20% faster. A seeded golden database with copy-on-write clones later cut deploys from 14.9 to 8 to 11 minutes.
- **Simulation platform from scratch.** A monorepo, 15 reusable Terraform modules with tests and Trivy scans in a private registry, a new VPC, ECS, AWS Batch and Aurora Serverless v2. Scaled Batch from 100 to 1,000 parallel jobs, and path filtering cut no-change builds from 6 minutes to 30 seconds.
- **ML platform account migration.** Moved SageMaker pipelines, MLflow and inference (about 66 Terraform resources) into a dedicated AWS account. Production cut over with zero errors and zero throttling.
- **Just-in-time database access.** After approval, a time-boxed, IAM-authenticated and audited PostgreSQL login exists in about 9 seconds and expires on its own. 65 automated tests, approved by Security.
- **Emergency deploy pipelines.** Parallel production deploys aimed at 5 minutes instead of 30, and staging in about 5.5.
- **AI agent platform infrastructure.** Rebuilt staging and dev on EKS with no interruption, added PR-comment deploys with scale-to-zero, and removed deploy downtime with readiness gates, preStop hooks and graceful drain. Rolled out least-privilege IAM for agent pods, limited to Bedrock model calls, across three environments.
- **QA database refresh.** Rebuilt the weekly refresh of ten QA databases with Step Functions: hours to minutes.
- **OpenSearch upgrade.** Moved production from r6g to r8g and gp2 to gp3, zero downtime: 30% faster, 10% cheaper.

Blue Apron

- **Preview environments.** Built inside the staging EKS cluster, so feature branches run against real staging services.
- **Self-service CDN pipeline.** Fastly CDN changes through Terraform, with plan on PR and apply on merge.
- **Cross-account Redis migration.** Moved ElastiCache Redis to a new AWS account inside a 1-hour downtime window, with scripted snapshots and a Route 53 cutover.
- **Developer CLI in Go.** AWS login, Kubernetes restarts and logs, hostname lookup and Parameter Store secrets.

PERSONAL PROJECTS

Tardeo Club (2026 - present). Booking, membership and operations platform for a social tennis club in two cities, live at tardeosocialclub.com. Next.js, Supabase with row-level security, Stripe, Shopify and an ops console behind MFA.

Squadra (2026). Production web app for a private World Cup prediction league. Next.js, Supabase Auth, Postgres row-level security and realtime updates, on Vercel.

CERTIFICATIONS

Certified Kubernetes Administrator (**CKA**), The Linux Foundation, Feb 2024, valid until Feb 2027. Credly

HashiCorp Certified: Terraform Associate (**003**), HashiCorp, Sep 2025, valid until Sep 2027. Credly

AWS Certified Solutions Architect - Associate, Amazon Web Services, Jun 2023, expired Jun 2026.

EDUCATION

Polytechnic University of Madrid — **Madrid, Spain**
B.S. Software Engineering — **2018 - 2022**
